DID YOU KNOW?

Gardening on the mountaintop can be challenging due to our 2,000 foot elevation and subsequent very short growing season. Many of our crops come in months later than their counterparts elsewhere.

The use of companion plantings combined with our adjacent meadows provides an ideal habitat for bees, wasps, butterflies and the myriad of other pollinators so necessary for crop success. You may even see the intriguing hummingbird-hawk moth in the right season.

Our most popular veggie crop is kale as it thrives in the cool mountain climate and can be harvested right through 'til Thanksgiving.

We choose varieties of veggies and flowers that may be unfamiliar as they may be bred for flavor, short crop time or a have an unusual aesthetic.

A FEW Q'S...

DO YOU GROW ORGANICALLY?

We follow clean, horticulturally sound practices that are safe for both the garden and the gardeners.

DOES THE GARDEN PROVIDE PRODUCE FOR THE RESTAURANT?

Our goal is to have something from the garden on the Prospect menu at all times during the season.

WHAT CAN I GROW AT MY CITY APARTMENT?

Even the smallest outdoor spaces can sustain gardens in pots, like salad greens, herbs or patio tomatoes.

HOME GARDEN TIPS

Follow the sun, be aware of when sunlight actually shines on your garden and for how long. This will determine what's best to grow.

Grow plants you really enjoy that you may have trouble finding.

Soil health, fertility and compatibility are essential for good growth. Pay attention to the root zone, it's at least half the plant.

Only grow what you can handle. Hone in on how much time you can commit to your garden, keep things small and manageable.
